

CarbaCamp

Assessment of phenotypic carbapenem susceptibility and genomic epidemiology of *Campylobacter* from animal, food and human domains

Athina Andrea

PostDoc Microbiologist

National Food Institute, Technical University of Denmark

EU Reference Laboratory for AMR

17th EURL-AR workshop 2023 (virtual)

24-05-2023

2018

Evidence of carbapenem non-susceptibility in *Campylobacter* in humans

- Hagiya et al., 2018
- Lehours et al. 2018

2020

ETP resistance included in the AMR monitoring of *Campylobacter*, by the Commission Implementing Decision (EU) 2020/1729

- Range 0.125 – 4 mg/L
- ECOFF = 0.5 mg/L

Disagreement on ECOFF:

- No ECOFF by EUCAST
- CLSI (M100-S32) recommends using the breakpoint of 16 mg/L for imipenem and meropenem (defined for other non-Enterobacteriaceae).
- Breakpoint of 1 mg/L is proposed by Comité de l'Antibiogramme de la Société Française de Microbiologie (CASFM) 2018 for ETP.

ETP resistance included in the AMR monitoring of *Campylobacter*, by the Commission Implementing Decision (EU) 2020/1729

- Range 0.125 – 4 mg/L
- ECOFF = 0.5 mg/L

Feb. 2023

Observations from the Austrian Agency for Health and Food Safety (AGES) shared with the EURL-AMR:

- High rates for ETP non-susceptible *Campylobacter* from food animals
- Possible different wild-type distributions between *C. jejuni* and *C. coli*.

Mar. 2023

EURL-AMR organized a webinar with the EURL network, EFSA and ECDC. Data discussed within the network and:

- Dr. Philippe Lehours, University of Bordeaux, PU-PH, Bordeaux, France, an expert in AMR as well as with
- EFSA
- ECDC
- subsequently by the European Committee on Antimicrobial Susceptibility Testing (EUCAST).

Resistance rates for ertapenem in *C. coli* (R>0.5)

Broiler caeca 2022, *C. jejuni* n=181, *C. coli* n=48

Turkey caeca 2022, *C. jejuni* n=50, *C. coli* n=27

Broiler meat 2022, *C. jejuni* n=91, *C. coli* n=54

Pig caecum 2021, *C. coli* n=191

Main questions emerged from the webinar:

- Is the present ECOFF for ETP set correctly ?
- Is ETP the best carbapenem for the tests ?
- What is the effect of using EUCAST versus CLSI recommended media for AST?
- Are there any differences in the wild-type populations between animal types and between species?
- Can a resistance mechanism be identified as responsible for the higher MIC levels ?

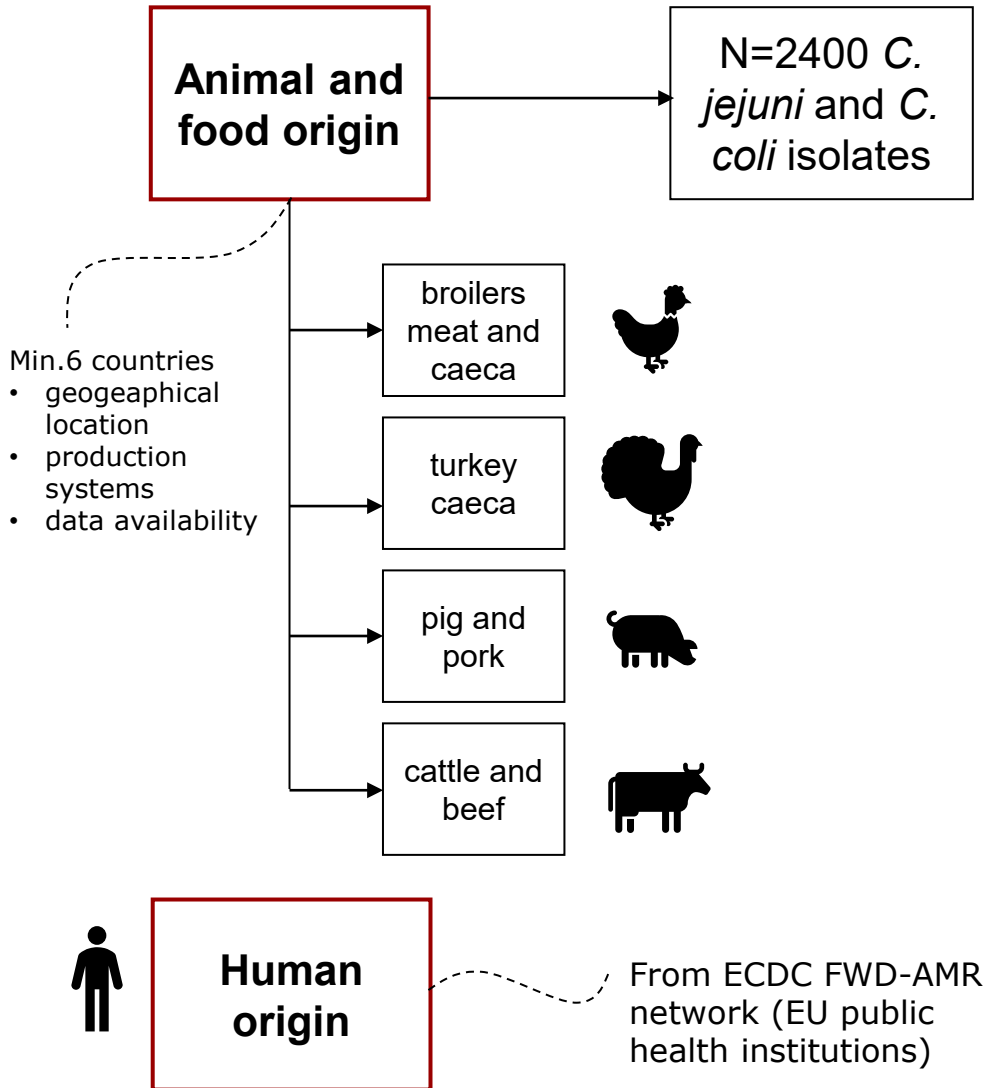

EFSA requested a proposal from the EURL AR with high priority to urgently address the issues.

"CarbaCamp"

- **Project duration:** 24 months from the kick-off meeting
- **Collaborator:** EUCAST Development Laboratory (EDL)
- **Project structured in 6 "Tasks"**

Task 1 – Collection of strains

- ⇒ strain collections from interested NRLs of the EURL AR network providing data to the EFSA surveillance of AMR.
- ⇒ NRLs that have submitted most Campylobacter data of the four animal and food domains to the EFSA surveillance of AMR will be targeted (Survey)
- ⇒ The animal and food strain collection will be based obtaining a representative diversity of strains representing different MIC distributions against ETP ensuring isolates across the MIC range of 0.125 – 4 mg/L.
- ⇒ MTAs between DTU and NRLs

All strains shipped to DTU for analysis

⇒ Six antimicrobials selected by EDL:

- Meropenem
- Ertapenem
- Imipenem
- Pefloxacin (screening for fluoroquinolone resistance)
- Erythromycin (screening for macrolid-resistance)
- Tetracycline.

⇒ *C. jejuni* strain ATCC 33560 will be used for quality control.

⇒ EUCAST DD protocol for *Campylobacter* (https://www.eucast.org/ast_of_bacteria/disk_diffusion_methodology) using Muller Hinton agar (MHF (EUCAST recommendation)) of two different suppliers e.g. Oxoid and BioRad

Task 3- AST by broth microdilution

Animal and food origin

N=2400 *C. jejuni* and *C. coli* isolates

DD results

600 isolates

200 isolates

- => AST by broth microdilution
- => Custom sensititre plate design – 500 plates minimum order
- => Ertapenem, imipenem, and meropenem
- => range from 0.002 to 32 mg/L.
- => Half a plate for one strain => 300 plates for 600 isolates
- => MH-F (EUCAST recommendation)) of two different suppliers every second week following the EUCAST testing principle

test a subset of the same isolates using the MH+LHB (CLSI recommendations) broth in comparison to MH-F

Human origin

N=100 isolates

Task 4&5- WGS and in silico analysis

- presence of known antimicrobial determinants e.g. *bla*OXA and resistance mutations *por*A or *cme*ABC
- relevant epidemiological markers, and phylogeny using both a gene by gene; cgMLST and SNP approach based on the experience of the EFSA GenCamp project (<https://www.efsa.europa.eu/en/supporting/pub/en-1398>).
- In addition, the data will be further investigated to detect novelties explaining the non-susceptibility to carbapenems.
- All raw data of the study will be supplemented with additional *C. jejuni* and *C. coli* genomes from ENA

Expected Outcomes

- To determine the wildtype MIC distribution between *C. jejuni* and *C. coli* as well as between the four animal domains and in humans by disk diffusion and broth microdilution.
- To determine the comparability between the EUCAST and CLSI recommended media for MIC determination of *Campylobacter*.
- To determine the genomic diversity of susceptible and nonsusceptible *C. jejuni* and *C. coli* across the different animal species and humans in EU.
- To determine which of ertapenem, imipenem and meropenem would be most suitable for the monitoring of *Campylobacter*.
- To investigate potential resistance mechanism conferring nonsusceptibility to carbapenems as well as the role of blaOXA genes observed in *Campylobacter*.
